I randomly run 10 times with the different scenario automatically.

Step 1: I desgined some type of serial number to insert the textbox. The program will randomly choose one from the pool ('1863552437', '123', '186355243a', '!@#4', '0021!','186355243!','1863552417').

step2: click get info button

Step3: check the corresponding message. I list three type of the message as below.

Case: insert "1863552437", check device info

case: insert length < 6 message, check error message

case: insert length > 6 and not equal with 1863552437

case: if you get correct length of serial number, but not equal to 1863552473. The verification result will be" sorry! you get correct length of serial number, but i only have 1863552437 device info to do validation."
